

Hospital Management System (HMS) with **Frontend, Backend, and Database integration**, you can include the following content in your project report.

Project Title

Hospital Management System Using React, FastAPI, and MySQL

Abstract

The Hospital Management System (HMS) is a web-based application developed to automate and streamline hospital operations. The system provides an integrated platform for managing patients, doctors, appointments, admissions, billing, laboratory records, inventory, prescriptions, and medical records. The primary objective of the project is to reduce manual paperwork, improve data accuracy, and enhance the efficiency of hospital administration.

The frontend of the application is developed using React.js, providing a responsive and user-friendly interface. The backend is implemented using FastAPI, which offers high-performance API services and efficient data processing. MySQL is used as the database management system to securely store and manage hospital data.

The system enables administrators and hospital staff to perform CRUD (Create, Read, Update, Delete) operations on various hospital entities. It also provides dashboard statistics, record management, and real-time data retrieval through RESTful APIs. The project demonstrates the integration of modern web technologies to build a scalable, maintainable, and efficient healthcare management solution.

Objectives

1. To digitize hospital management processes and reduce manual record keeping.
2. To maintain accurate patient, doctor, and appointment information.
3. To provide a centralized database for hospital operations.
4. To improve operational efficiency and reduce administrative workload.
5. To enable quick access to medical records and billing information.
6. To ensure secure and reliable storage of hospital data.
7. To provide a user-friendly interface for hospital staff and administrators.

Technologies Used

Component Technology

Frontend React.js

Backend FastAPI (Python)

Database MySQL

API Testing Swagger UI / Postman

IDE Visual Studio Code

Modules Implemented

The Hospital Management System consists of multiple modules that work together to manage hospital operations effectively:

1. Dashboard Module – Displays hospital statistics and summary information.
2. Patient Management Module – Manages patient registration and records.
3. Doctor Management Module – Stores doctor details and specialization information.
4. Appointment Management Module – Handles appointment scheduling and tracking.
5. Admission Management Module – Manages inpatient admission records.
6. Billing Module – Generates and maintains billing information.
7. Laboratory Module – Stores laboratory test details and results.
8. Inventory Module – Tracks medicines and medical equipment.
9. Medical Records Module – Maintains patient medical history.
10. Prescription Module – Stores doctor prescriptions and medication details.
11. Insurance Claims Module – Manages insurance-related information and claims.

System Architecture

Key Features

- User-friendly dashboard interface.
- RESTful API integration.
- Patient and doctor record management.
- Appointment scheduling and tracking.
- Billing and admission management.
- Laboratory and prescription management.
- Centralized database storage.
- Scalable and modular architecture.
- Fast data retrieval and processing.
- Responsive web application design.

Conclusion

The Hospital Management System successfully automates various hospital operations through a modern web-based platform. By integrating React.js, FastAPI, and MySQL, the system provides efficient data management, improved accessibility, and reduced administrative effort. The project demonstrates the practical implementation of full-stack web development concepts and database management techniques. It can be further enhanced with features such as authentication, role-based access control, analytics dashboards, and cloud deployment for real-world hospital environments.

You can directly use these sections in your VTU project report under **Abstract, Objectives, Modules, Technologies Used, Features, and Conclusion.**
